Do not write below this line

**CLO # 1:** Recognize the fundamental economic and financial considerations involved in engineering projects

**Q1: Construct** a table to repay the loan of \$180,000 in five years at 12 % per year compound interest such that equal payments are made each year including principal and accrued interest. [Marks: 25]

| End of Year | Interest owed for year | Total owed at end of year | End of year payment | Total owed after payment |
|-------------|------------------------|---------------------------|---------------------|--------------------------|
| 0           |                        |                           |                     |                          |
| 1           |                        |                           |                     |                          |
| 2           |                        |                           |                     |                          |
| 3           |                        |                           |                     |                          |
| 4           |                        |                           |                     |                          |
| 5           |                        |                           |                     |                          |

**CLO # 1:** Recognize the fundamental economic and financial considerations involved in engineering projects

**Q2:** For the cash flows shown in the diagram, **compute** the single amount of money  $Q_4$  in year 4 that is equivalent to all of the cash flows shown. Use  $i = 10\%$  per year. [Marks 25]

**National University of Computer and Emerging Sciences**  
Lahore Campus

**CLO # 1:** Recognize the fundamental economic and financial considerations involved in engineering projects

**Q3:** If the value of Jane's retirement portfolio increased from \$170,000 to \$813,000 over a 15 year period, with no deposits made to the account over that period, calculate annual rate of return did she make.

[Marks 10]
